accounting technology world, we were making the gargantuan leap from the VisiCalc spreadsheet and WordStar word processing software to Lotus 1-2-3 and WordPerfect.

Dec. 01, 2008

If you're young enough, think back to the period starting in the early 1980s. In the accounting technology world, we were making the gargantuan leap from the VisiCalc spreadsheet and WordStar word processing software to Lotus 1-2-3 and WordPerfect. "Back in the day," those were considered premier applications. It would be fun to show those applications to a group of young professionals today to get their reaction. The other big technology issue of the day, back then, was the initial movement towards PC-based accounting systems, such as Open Systems, State Of The Art, Great Plains and many more, which, by the way, have evolved and survived more than 25 years later. In retrospect, it has been an interesting stretch of time for technology in the tax and accounting profession.

What does this have to do with document management software? Well, the point is that spreadsheets, word processors and accounting systems were the new frontier of the early '80s. The same can be said of document management software relative to the start of the new millennium. It is only within the past few years that this type of application has started to gain significant momentum. We can draw a number of parallels between the evolution of document management software (DMS) and general accounting software to help us gain some insight into where the DMS market is likely to head.

In the early days of accounting software, life was pretty simple. Essentially, the objective was to provide an automated system to replace the pegboard system. Typically, the first generation accounting packages had a very simple design: Enter transactions, print source documents, post transactions and print reports. This

model was replicated for all of the classical systems: general ledger, accounts payable,

this review is structured.

Executive Summary

- The document management and storage market is evolving rapidly with a number of new offerings and extended feature sets.
- “Intelligent scanning” comes of age with products such as CCH’s ProSystem *fx* Scan and Thomson’s GoFileRoom TaxSort. *Document management* is evolving to be more about *file management*.
- Niche solutions designed with a specific focus such as SourceLink Management Edition (with its seamless integration with QuickBooks) are evolving.
- Web-hosted solutions are gaining in popularity **and offer a compelling alternative.**

A wide variety of DMS solutions are available for accounting and tax practitioners. They range from the basic document storage systems to comprehensive document management systems. As with accounting software, one is not necessarily better than the other. What’s best for your firm depends upon the nature of your practice in terms of size, services offered, personnel, culture and more.

Let’s try to simplify the distinction. On one hand, the document storage systems are fundamentally designed for the purpose of creating an electronic document filing system. The primary difference between these systems and what you can already do with the Windows file storage system is the ability to use an indexing based file organization model, similar to the card catalogue system at the public library. Document storage systems are intended to be limited in their scope and functionality to help keep them simple and affordable. On the other hand, document management systems are evolving to be a comprehensive collection of document filing, automated

scanning, electronic annotation and paperless workflow tools. And the feature list

DMS REVIEW CRITERIA

As with any software application, the challenge in selecting the best solution for your practice is to determine what features to look for and what level of detail to drilldown to in regards to your evaluation and due diligence. The fact of the matter is that many different factors will help determine the success or failure of a technology initiative beyond the software's features and functionality. To help you through the selection process, this review identifies eight key attributes to consider when choosing a DMS program for your organization.

Usability

This is the most important attribute of all. How easy is the system to work with? Is it intuitive? Everyone has a different perspective on their "user experience" when interacting with a system, but you should focus on some basic criteria to assess a system's usability, such as the following:

- **Filing/indexing methodology** — This is how the system organizes the documents and files in the system. Look for a cabinet/drawer/folder approach that will provide a more natural transition from your traditional paper-based file organization as well as from Windows Explorer for your electronic files. You should also look for the ability to customize the index values, or metadata tags, based on the nature of the document.
- **Retrieval** — This refers to the ability to quickly locate the documents/files you need by entering the appropriate index values, or through advanced context-based searching tools.
- **Viewing** — Look for the ability to preview a document before it is "opened." When you do open a file for full viewing, determine if the native application is required (i.e., Adobe, Word, Excel, etc.) or if the system includes a proprietary viewer tool that eliminates the need to have the native application open.

- **Annotation** — When you go “paperless,” that means you are going “pencil-less,”

Integration

You'll want to look for three levels of integration. The most basic integration is with MS Office and Outlook. Since these applications are so prevalent in the typical accounting and tax practice, you want the ability to easily move documents in and out of the DMS from/to these applications. The second level of integration to look for is integration with accounting and tax applications (i.e., tax software, audit software and practice management). The better the integration, the more you will be able to drive unnecessary procedures out of your workflows. On a more sophisticated level, look for advanced integration capability through some form of a SDK (software development kit). This will provide the potential to develop integration to nearly every application in your firm, which you will want to do as your implementation matures.

Records Management

You should look for three basic features in the area of records management: security, retention and audit trail. Security will range from system access controls and document-level access controls based upon the nature of the document as well as the role of the individual. Advanced security features will allow you to control what functions the user can perform on the document once it is accessed (i.e., can you e-mail or print the document?). Retention features address your ability to establish a document retention policy for your firm and apply it automatically based upon the nature of the document (i.e., tax return documents are automatically purged seven years from the initial document creation date). Finally, audit trail functionality refers to the system's ability to keep a record of all activity within the system by user and date. Typically, this includes what documents were viewed, filed, edited, printed, e-mailed and more.

Scanning

Hello. It looks like you're using an ad blocker that may prevent our website from working properly. To receive the best experience possible, please make sure any blockers are switched off and refresh the page.

If you have any questions or need help you can email us

Scanning today includes automatic document recognition and indexing, document clean-up, and automatic bookmarking.

Workflow Automation

This is usually offered as an add-on module. Workflow features can be wide ranging — route a document to a specified individual, attach action item requests to the document, electronic routing sheets, e-mail alerts, and routing notes. Advanced features include the ability to map out an entire business process and schedule the routing of a document or group of related documents to pre-assigned individuals. Integration with staff scheduling may be a component.

Portal

The typical portal model is to have a website page that can be accessed via a secure user login ID and password. A basic “one-way” portal allows you to publish documents (i.e., tax returns and financial statements) that can be accessed for viewing, printing and downloading. A “two-way” portal provides the capability for the user to upload files remotely (i.e., QuickBooks files). Advanced portal functionality includes interactive content such as news feeds, announcements, real-time financial information and more.

Technology

Generally, there are three distinct categories of technology platforms for which DMS systems are available: standard server, SQL server or hosted. A standard server solution will not likely require any upgrades to your existing server, other than perhaps additional storage capacity. A SQL server system will require you to obtain the appropriate SQL licenses and may require a separate server. A hosted solution means that the vendor provides all of the necessary network infrastructure and administration services for you to access remotely. Some vendors provide both an in-house server-based solution and a hosted option (click on chart for full-size PDF).

overall context of where the particular solution fits. Therefore, be sure not to place too much emphasis on using the ratings to compare one product directly against the others. Let's take a closer look at the different DMS solutions included in this review.

Acct1st Technology Group LLC — Acct1st EDRMS

Acct1st is developed with the combined efforts of a Dallas-based CPA firm and a Seattle-based software development organization. It is very much an “accountant-centric” application and offers the best of both worlds in terms of allowing the choice between deploying it on your internal server or using the vendor’s secure web hosting service.

CCH, a Wolters Kluwer business — ProSystem *fx* Document

ProSystem *fx* Document has been a part of the CCH product family for over two years now. It was originally developed within a CPA firm so, by its nature, it has been built as an accountant-centric application. The integration with the other CCH applications continues to evolve nicely, as well.
