From the October 2005 Issue

A note from Gregory L. LaFollette, CPA.CITP, Executive Editor:

MICROSOFT officially launched its Small Business Accounting program on September 7, 2005. This long-planned launch just happens to coincide (well, within a few months anyway) with rival **INTUIT**'s release of QuickBooks 2006, which just happens to be the most revolutionary rewrite of the company's flagship product since it's original release. What does this mean to us, the practitioners, and what do we say to our clients when they ask the [inevitable] question: "Which product is better?" Contributing writers Randy Johnston and Doug Sleeter have crafted an outstanding article dedicated precisely to helping you answer that question. You'll also find excellent analysis from developer Shafat Qazi and from Technology Editor Isaac O'Bannon. Taken as a whole, these articles represent the profession's most thorough expert examination of the Intuit – Microsoft question. Note that, in our opinion, the correct question is NOT "Which product is better?" but rather "What software should (enter your specific client here) use to manage its small business?" We hope you find this section particularly helpful, and, as usual, we look forward to your feedback. And, also as usual, remember that you can count on The CPA Technology Advisor for more coverage of these important products in future issues.

Microsoft's Entrance Draws Attention Of SMB Accounting Vendors

Over the last year, much of the attention in the small business accounting area has been focused on the brewing showdown between Intuit's QuickBooks software and the just-released Small Business Accounting program from Microsoft. The entrance of Microsoft will likely have major effects on this market in the coming years, and the increased competition should spur continued development of functionality and features in accounting software. QuickBooks currently accounts for about 90 percent of the small business accounting software sold at retail stores each year.
