To many small business owners, accounting can seem like a foreign language and can be as hard to comprehend as the hypotheses of Dr. Stephen Hawking. On the other hand, some people just get it. Hopefully, most of you reading this are in this latter group since you are in the tax and accounting profession. You understand the science behind it, more than just the generally basic math.

You understand the necessity of properly maintained accounts and the methods by which to track and correct errors and imbalances. And, in some cases, you have the cunning ability to don the gumshoes of a sleuth to find the causes of more serious financial irregularities. It is the combination of these capabilities that brings the accounting profession near to being an art form. Well, sort of.

We are not, of course, espousing the use of creative license when it comes to your clients' financial records, but rather pointing out that the broad scope of accounting functions requires both logic and the touch of a muse. Not all are gifted with these attributes, but small business owners still need to accurately maintain their business records on a day-to-day basis. This is the job of small business accounting software, for which small business owners have a wide variety of options.

In addition to keeping proper books, these programs can improve efficiency, help them better serve their customers, perform payroll tasks and related compliance issues, offer invoicing and correspondence functions, offer analysis and planning, and many other functions. But since your small business clients are not likely to be as knowledgeable and adept at accounting and business process functions, a small business accounting program's ease-of-use is often paramount to whether it is properly employed.

And that is where the vendors and software programmers exercise their mix of science and creativity. Make no mistake, what they do certainly is art, for they are

charged with taking the complex, interrelated scientific accounting principles and

and reconciliation, automatic tax and payroll updates, and even fully web-based accounting systems.

These systems now offer features that would have been available only in very high-end programs just a few years ago, including varying levels of inventory support, industry-specific templates and workflow processes, strong sales and invoicing, decent customer relationship management modules, highly customizable report options, integrated communications, analysis capabilities and scheduling functions. In short, these programs have essentially become enterprise resource planning systems (ERPs) for small businesses, integrating all core functions of the business.
